

# Prime Minister Abe's visit to Bangladesh Presentation by POLY-GLU GROUP C.E.O Kanetoshi Oda

6th, Sep, 2014

POLY-GLU is a Japanese small company which has disseminated water supply technology in this country since 2008. Mr. and Ms. Cabinet members, top leaders of bank, academy, and industrial world, and such a many press people, it is a great honor to have an opportunity to report my company's business to you all. First of all, please let us show you the demonstration of our water purification technology. Ms. Nilufa from Barguna is going to show it. Prime Minister Abe introduced her at the 68th UN General Assembly.

This dirty water is from Gulshan lake. It contains a lot of impurities and Bacillus coli. Add small amount of water purification agent and chlorine to the water, and mix them well. I taught Ms.Nilufa how to purify the water but now she can do it better than I. Please look at this. The dirt in the water has started to stick each other very soon. The upper part has become this clean.

We usually use sand and gravel for filtration, but this time, let's use my handkerchief. See? It's very clean and clear water, isn't it? It's also safe and tasty. Now let me drink it. Yes, it's delicious. The main component of the water purification agent is the sticky substance in nature which is the same with that of Japanese traditional food "Natto". I believe you understand it soon by seeing the demonstration, but only if there are tanks, anyone can make the water purification equipment to purify big amount of water.

Prime Minister Abe introduced Ms.Nilufa in his speech at 68th UN General Assembly.

Ms.Nilufa has worked as Poly-Glu Lady for 2 years.

Large sized water purification plant in Tanzania which purifies 50 to 100 ton of water per day.
